asset_list_updated.json;

Dear EBOS colleagues,

First of all, thanks a lot for your review and for the detailed comments. We have considered the points raised and have also further refined the Asset Library. The updated catalogue now contains 175 assets, and the revised JSON file is attached.

Please find our responses below.

1. Yes, this is the intended interpretation. 'typical_criticality' represents the typical operational criticality associated with a given asset type, i.e. the expected significance of its compromise or disruption within an IT/OT system. For example, a terminal would typically be considered less critical than a server, given their usual roles, dependencies and potential operational impact.

The value can therefore be used as an input to the Impact component of the risk calculation and should be treated as a default/reference value. Please note that we have reviewed and updated these values in the attached catalogue following this interpretation.

The default value could subsequently be overridden or refined in the Hub in two alternative ways:

(a) User-defined override: the GenAI Mapper user may manually assign a different criticality value to reflect the specific deployment, operational role or business context of the asset.

(b) Calculation-based refinement: criticality could alternatively be derived through a defined calculation procedure considering the asset's role within the specific system. For example, network-topology information and graph-centrality measures such as Degree, Closeness, Betweenness, Eigenvector Centrality and PageRank could be combined to provide an indication of an asset's structural importance. However, such an approach would strongly depend on the completeness and accuracy of the network abstraction. We can further support this approach, if needed.

2. Our current view is that the 'layer' and 'zone' fields should be used as-is, as they capture the functional position and operational/security domain of each asset. The Physical, Logical and Communication concepts described in the GA may be better treated as separate architectural views over the same asset inventory, rather than as direct replacements for the existing 'layer' values.

For example, in a SCADA-based system, a PLC may be classified as layer = Field and zone = OT, a SCADA Server as layer = Control and zone = OT, and the network switch connecting them as layer = Infrastructure and zone = OT. The same assets can then be represented differently depending on the architectural view. The Physical view can show the actual devices and their locations, the Logical view the PLC-SCADA functional/control relationship, and the Communication view the network paths and communication infrastructure connecting them.

3. This was indeed an inconsistency in the previous catalogue. Driver Console and On-board Computer assets should be classified as zone = OT, consistently with the other operational vehicle assets.

We agree that 'Vehicle' describes the deployment context/location rather than a cybersecurity zone and should therefore not be used as an alternative to IT/OT. This has been corrected (i.e., removed) in the updated catalogue.

4. We believe that 'External' should not be globally mapped to either IT or OT, as it represents the asset's external/trust-boundary context rather than its functional domain. External assets may support either IT or OT functions depending on the specific deployment.

For the risk analysis, we therefore suggest, if possible, retaining 'External' as a separate contextual classification and, where an IT/OT distinction is required, assigning IT or OT separately based on the asset's actual function and connectivity.

5. The presence of the Hydrological Monitoring Station in both Maritime & Port and Inland Waterways initially reflected its operational relevance to both domains. However, as part of the latest taxonomy refinement, we have removed this duplication and unified it into a single shared entry.

We have also introduced a dedicated Cross-Domain Infrastructure (CDI) category for assets that are relevant across multiple transport domains. This also contributed to the consolidation of the catalogue to the current 175 assets.

As a general note, the values provided in the Asset Library should be considered as default/reference values based on typical asset characteristics and deployment assumptions, rather than fixed assignments. Therefore, we recommend that the relevant asset attributes remain editable by the Hub user to allow the asset model to be adapted to the specific system being analyzed. In the same spirit, it would also be useful to allow users to define custom assets that may not be covered by the Asset Library, including their associated attributes.

Please find the updated JSON catalogue attached. We would be happy to discuss any of the above points further if useful.

Best regards,

Dear CERTH-HIT team,

I hope you are doing well.

This is a friendly reminder regarding our clarification requests on the Asset Library catalogue that we shared following the Plenary Meeting. We would greatly appreciate receiving your feedback **at your earliest convenience**.

Please let us know if any clarification from our side would be helpful.

Thank you in advance for your support and collaboration.

Kind Regards,
Spyroulla

Subject: [TRANSPORT] Asset Library - Clarifications

Dear CERTH-HIT Team,

Thank you for sharing the Asset Library catalogue with us. As mentioned during the Plenary Meeting, our technical team has reviewed the Library and has a few clarification requests. We would appreciate your assistance in addressing the following points:

- 1) Could you clarify what typical_criticality is meant to represent? Our preference is for this field to capture operational criticality, i.e., how much it would matter if the asset were compromised. Under this interpretation, it would serve as a strong input signal for calculating Impact, one of the two components of Risk. We would also like this value to act as a default that can be overridden by the Hub's user.
- 2) Are the layer and zone fields intended to be used as-is, or should they be mapped to the physical, logical, and communication layers described in the Grant Agreement? We are able to work with either approach.
- 3) We noticed that all assets in the Vehicle category use zone = OT. However, the PT6 (Driver Console) and PT7 (On-board Computer) assets (Public Transport) use zone = Vehicle. Is this intentional, or should these two assets also be classified as OT?
- 4) Some assets use zone = External. For our risk analysis, we need to know whether these assets should be treated as OT or IT. Could you please advise which one should be used?
- 5) "Hydrological Monitoring Station" appears twice in the catalogue, under different categories (MA11 - Maritime & Port and IW6 - Inland Waterways). Is this intentional, since the same asset type may be relevant to both domains, or should there be a single, shared entry instead?

We agree with consolidating the library to approximately 150 entries and would appreciate your consideration of the points above during revision.

Please let us know if any clarification from our side would be helpful.

Kind Regards,
Spyroulla
